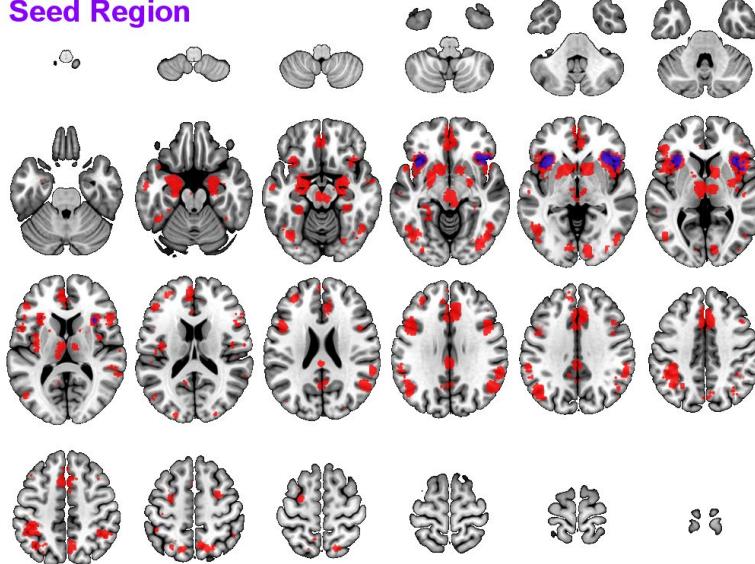

Figure S1. Masks and derived seed-regions used for the seed-based analyses. Masks were derived from automated meta-analytic data provided by Neurosynth (Yarkoni, Poldrack, Nichols, Van Essen, & Wager, 2011) using the 'default mode' (<http://www.neurosynth.org/analyses/terms/default%20mode/>) and 'salience'

(<http://www.neurosynth.org/analyses/terms/salience/>) terms. Posterior cingulate cortex and anterior insula ROIs were derived from these maps for use in the seed-based analyses.

Table S1. Means (S.D.) and frequencies for demographic data and drug use for participants. Data was missing for one participant for BDI, TEPS and drugs history. TEPS = Temporal Experience of Pleasure scale. BDI = Beck Depression Inventory. SDS = Severity of Dependence Scale.

Results

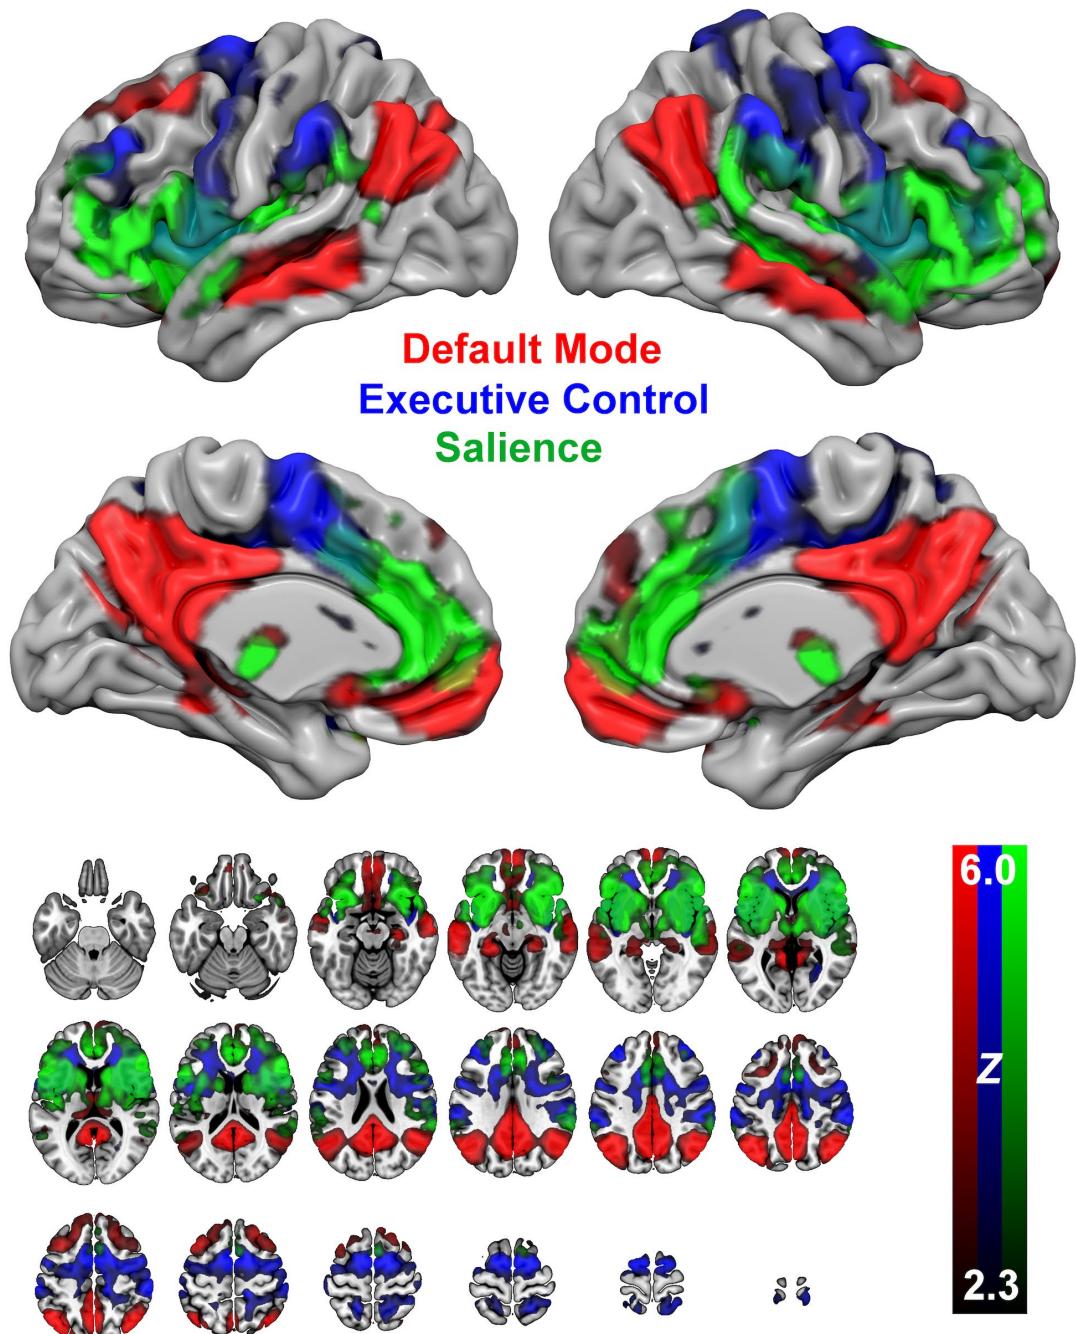

Figure S3. Mean (all subjects, all scans) functional connectivity maps from the seed-region analyses showing the Default Mode Network (DMN; defined by positive connectivity with the PCC seed region; red), the Executive Control Network (ECN; defined by negative connectivity with the PCC seed region; blue), and the Salience network (defined by positive connectivity with the anterior insula seed region; green).

Table S2. Coordinates of the major activation clusters shown in Figures 2, 3, and 4 of the main text. Z-Max = Maximum Z-score in cluster. LH = left Hemisphere, RH = Right Hemisphere. COG = Centre Of Gravity. Coordinates are in MNI space. Z values are negative as only reductions in connectivity (relative to placebo) were found.
