

Supplemental Figure Caption. Care activities required for surgical clearance included development of a peri-operative care plan, referrals, communications with providers, and radiographic/laboratory testing. Shown are the percentages of all care activities associated with each organ system (e.g., 38% of all care activities were associated with clinical work to optimize the children's neurologic health).

Supplemental Figure. Organ Systems Associated with Last-Minute, Care Activities Performed During the Pre-Anesthetic Evaluation for Children with Neuromuscular Scoliosis Undergoing Spinal Fusion
