# Development and Validation of a New Multidimensional Language Class Anxiety Scale - Supplementary Materials - 

This document contains materials designed to supplement the main text. The materials include the following:

The structures of the model with the best fit and of the others

Figures
Appendix containing all self-report items used in the study
Mplus Syntax

The structures of the model with the best fit and of the others are explained in detail below:

## Hypothesized models of L2 anxiety.

Model 1: Lower order correlated residuals. Model 1 hypothesizes that thirty items form into five lower order factors namely listening activity anxiety (LAA), reading activity anxiety (RAA), speaking activity anxiety (SAA), writing activity anxiety (WAA) and classroom testing anxiety (CTA). It is also assumed that the lower order factors correlate with each other. Six items are attributed to each L2 domain. Within each L2 domain, there were two cognitive items, two affective items, two physiological items. In this model, the residuals variances of cognitive, affective and physiological items across different L2 domains were allowed to correlate (Figure 1). The correlated residuals were specified a priori. Without exception, all the residuals variances of the cognitive, affective and physiological items across different L2 domains were allowed to correlate (e.g., A1 with A2; C3 with C4; P5 with P6).

Model 2: Higher order correlated residuals. This model is an extension of Model 1. In addition to five lower order factors, in this model, it is hypothesized that all covariance between lower order factors can be explained by a single higher order factor which is termed Language Class Anxiety (LCA). Correlated residual variances of cognitive, affective and physiological items across L2 domains were also included in this model (Figure 2). Like Model 1, the correlated residuals were specified a priori. Without exception, all the residuals variances of the cognitive, affective and physiological items across different L2 domains were allowed to correlate (e.g., A1 with A2; C3 with C4; P5 with P6).

Model 3: Lower order L2 anxiety with three method factors. In Model 3, instead of correlating the residuals of cognitive, affective and physiological items across L2 domains, these are introduced to the model as three method factors. It is hypothesized that the items load on both their theoretical constructs which are LAA, RAA, SAA, WAA and CTA and the latent method factors which are cognitive, affective and physiological constructs (Figure 3).

Model 4: Bifactor model with correlated residual variance. In Model 4, all the items load on one general factor representing Language Class Anxiety. Additionally, there are five group factors (LAA, RAA, SAA, WAA and CTA) which represent common factors measured by the items and potentially explain item response variance which could not be accounted for by the general factor. Correlated residual variances of cognitive, affective and physiological items across L2 domains were also included and allowed to correlate with each other. The general and group factors were uncorrelated (Figure 4). The correlated residuals were specified a priori. Without exception, all the residuals variances of the cognitive, affective and physiological items across different L2 domains were allowed to correlate (e.g., A1 with A2; C3 with C 4 ; P5 with P6).

Model 5: Bifactor model without correlated residual variance. Model 5 is almost the same as Model 4 except that in Model 5, correlated residual variances of cognitive, affective and physiological items across L2 domains were not included.

Figure 1. Lower Order Correlated Residuals. For simplicity, the relations between corresponding residuals were omitted.

Figure 2. Higher Order Correlated Residuals. For simplicity, the relations between corresponding residuals were omitted.

Figure 3. Lower Order L2 Anxiety with Three Method Factors.

Figure 4. Bifactor model with correlated residual variance. For simplicity, the relations between corresponding residuals were omitted.

## Appendix

## Listening Class Anxiety Scale

1. Thinking about listening activities in class makes me feel uneasy.
2. I feel nervous during listening activities in class.
3. Even before listening activities in class, I worry whether I will be able to understand the material.
4. I worry whether I am sufficiently prepared for listening activities in class
5. I get tense during listening activities in class.
6. When I don't understand something important during listening activities in class, my heart races.

## Writing Class Anxiety Scale

1. Thinking about writing activities in class makes me feel uneasy.
2. I feel nervous during writing activities in class.
3. Even before writing activities in class, I worry whether I will be able to understand the material.
4. I worry whether I am sufficiently prepared for writing activities in class
5. I get tense during writing activities in class.
6. When I don't understand something important during writing activities in class, my heart races.

## Reading Class Anxiety Scale

1. Thinking about reading activities in class makes me feel uneasy.
2. I feel nervous during reading activities in class.
3. Even before reading activities in class, I worry whether I will be able to understand the material.
4. I worry whether I am sufficiently prepared for reading activities in class
5. I get tense during reading activities in class.
6. When I don't understand something important during reading activities in class, my heart races.

## Speaking Class Anxiety Scale

1. Thinking about speaking activities in class makes me feel uneasy.
2. I feel nervous during speaking activities in class.
3. Even before speaking activities in class, I worry whether I will be able to understand the material.
4. I worry whether I am sufficiently prepared for speaking activities in class
5. I get tense during speaking activities in class.
6. When I don't understand something important during speaking activities in class, my heart races.
7. 

## Classroom Testing Anxiety Scale

1. Thinking about taking an English language test makes me feel uneasy.
2. I feel nervous while taking an English language test.
3. Even before taking an English language test, I worry whether I will be able to understand the material.
4. I worry whether I am sufficiently prepared for taking an English language test.
5. I get tense while taking an English language test.
6. When I don't understand something important while taking English language test, my heart races.

## Mplus Syntax for Model 4 in Study 1

Here we present an example of the Mplus syntax we used to generate data and fit the models with studied approaches.

```
Title: Pilot Study;
Data: File is 'Pilot_Study.dat';
Variable: missing = all (999);
    name = y1-y30
    Usevariables are y1-y30;
Analysis: Estimator = MLR;
        type = general;
```

Model: SAA by y1-y6;
RAA by y7-y12;
WAA by y13-y18;
LAA by y19-y24;
TAA by y25-y30;
LCA BY y1-y30;
!Affective items: y1-y2-y7-y8-y13-y14-y19-y20-y25-y26
!Cognitive items: $\mathrm{y} 3-\mathrm{y} 4-\mathrm{y} 9-\mathrm{y} 10-\mathrm{y} 15-\mathrm{y} 16-\mathrm{y} 21-\mathrm{y} 22-\mathrm{y} 27-\mathrm{y} 28$
!Physiological items: y5-y6-y11-y12-y17-y18-y23-y24-y29-y30
