

## **Smoking Modifies the Genetic Risk for Early-Onset Periodontitis**

S. Freitag-Wolf, M. Munz, R. Wiehe, O. Junge, C. Graetz, Y. Jockel-Schneider, I. Staufenbiel, C. Bruckmann, W. Lieb, A. Franke, B.G. Loos, S. Jepsen, H. Dommisch, and A.S. Schaefer

## **APPENDIX**

### **Supplementary Methods**

#### **Statistical analyses**

The case-only design requires a validation of the two key assumptions: (i) The disease is rare and (ii) the interaction variables are uncorrelated in the general population. Assumption (i) was fulfilled, since the prevalence of the analyzed disease phenotype is < 0.1% (4). In order to analyze whether assumption (ii) was met, we tested the association of G and S in controls (n=6823) from our recent GWAS [9]. Specifically, we tested  $\beta_G$  of  $\text{Logit}(P(S = 1)) = a + \beta_G G$  for each SNP.

The 918,514 SNPs with P-values < 0.05 (Wald-test) were excluded from further analyses, and the remaining 79,780,573 SNP were then evaluated in the cases for possible interactions with smoking. Following the case-only approach, the aforementioned estimator  $\hat{\beta}_G$  in the cases is an unbiased estimator  $\hat{\beta}_{G\times S}$  of the underlying interaction term of the equation

$$\text{Logit}(P(AgP = 1)) = a + \beta_G G + \beta_S S + \beta_{G\times S} G\times S.$$

To overcome the heterogeneity of the samples from Germany/Austria (Ger) and The Netherlands (NL), all described estimators were treated in a meta-analytical sense:  $\beta_{\text{Ger}_{G\times S}}$  and  $\beta_{\text{NL}_{G\times S}}$  were combined using the inverse variance-weight method (Sutton, 2000).

$$\text{The test statistic } T = \frac{w_{\text{Ger}}\beta_{\text{Ger}_{G\times S}} w_{\text{NL}}\beta_{\text{NL}_{G\times S}}}{w_{\text{Ger}} + w_{\text{NL}}},$$

with weights  $w_{\text{Ger}} = \text{var}(\beta_{\text{Ger}_{G\times S}})^{-1}$  and  $w_{\text{NL}} = \text{var}(\beta_{\text{NL}_{G\times S}})^{-1}$  follows a normal distribution with standard error  $\text{se}(T) = \sqrt{\frac{1}{w_{\text{Ger}} + w_{\text{NL}}}}$ .

Data management and statistical analyses was conducted using GenAbel (impute2databel: gtool -M -g -s, ProbABEL v. 0.4.4 function palogistic) [13] and PLINK v2.049 as well as R, version 3.4.1.

The genome-wide significance threshold for G×S interaction was  $P < 5 \times 10^{-8}$ . Suggestive association was considered if the p-value for association was  $P < 5 \times 10^{-5}$  for at least one SNP in a given locus, if that SNP was flanked by two or additional SNPs (located not more than 50 kilo base pairs (kb) distant to the lead SNP) that displayed association with a  $P < 10^{-5}$ .

### **Preparation of cigarette smoke extract**

Construction of the cigarette smoke extraction system and preparation of the cigarette smoke extract (CSE) was prepared as described in [15]. CSE was prepared from Roth-Händle unfiltered cigarettes (Reemtsma, Germany). For each CSE sample, smoke from four cigarettes was blown through 10 mL of cell culture medium. The CSE was subsequently filtered using a 0.2 µM sterile filter and diluted 1:5 with cell culture medium. Afterwards the CSE was directly added to the cells (2 mL per well).

### **Collection of gingival *ex vivo* biopsies**

*Ex vivo* biopsies from healthy oral masticatory mucosa were collected at the hard palate adjacent (<10 mm) to the fourth and fifth tooth by the use of a tissue puncher (3 mm diameter). The donors were orally and systemically healthy subjects. The Ethical Review Board of the Charité – Universitätsmedizin Berlin (EA4/088/15) approved this procedure.

Ten *ex vivo* biopsies from the hard palate were excised from the participants using 3 mm tissue puncher. To separate the epithelial cells from the fibroblasts, the tissues were dissected enzymatically by overnight incubation in 5 mg/ml dispase II (Sigma Aldrich) diluted in cell growth medium (DMEM, 1% Pen/Strep) at 4 °C. The primary gingival fibroblast cells (pGFs) were subsequently cultured in cell growth medium (DMEM, 1% Amphotericin B, 1% Pen/Strep, 1% non-essential Amino acids). Prior to CSE stimulation, the pGFs (passage 3-6) were seeded in 6-well tissue culture plates (TPP Techno Plastic Products, Trasadingen, Switzerland) ( $1.8 \times 10^5$  cells per well) 24 hours before stimulation. The CSE was freshly prepared at the day of stimulation. CSE induction was performed for six hours in ten biological replicates (each with three technical replicates) of pGFs, with aliquots of the same CSE. 2 ml medium without CSE was added to the control cell plates (three technical replicates for each of the ten donors). After 6 hours of CSE incubation, the cells were washed 2x with PBS. Cell disruption and total RNA extraction was carried out using the RNeasy Mini Kit (Qiagen) according to the manufacturer's instructions.

### **Screening of participants for a matched genetic background and genotyping**

Gingival *ex vivo* biopsies were harvested from 23 healthy patients and DNA was extracted using AllPrep DNA/RNA/miRNA Universal Kit (Qiagen). Blood samples were collected from the same individuals (N=22) in PAXgene Blood DNA Tubes and DNA was extracted using PAXgene Blood DNA Kit (Qiagen). To identify carriers of the common and minor alleles at the G×S associated haplotype blocks, we used the HiDi DNA polymerase (myPols, Germany) that allowed SNP discrimination for *SSH1* and *BMP7*. For *SSH1*, we genotyped rs73410922 (linkage disequilibrium [LD] to *SSH1* lead SNP rs59680006:  $r^2 = 1$ ; **Appendix Table 1**). For *BMP7*, we genotyped SNP rs6025513 (LD to *BMP7* lead

SNP rs6099553  $r^2 = 1$ ). The PCR was performed with the following settings: 95°C: 2'; 30 x [95°C:15'', 62°: 10'', 72°C, 30''] and the following primer sequences:

SSH1-G-allele_HiDi-fw-1	CACATCTTCCGTCTTCTTCCCAGTG
SSH1-A-allele_HiDi-fw-1	CACATCTTCCGTCTTCTTCCCAGTA
SSH1-rev-HiDi-1	CTGTCCCCCAACTATGACGGCAGTG
BMP7-G-allele_HiDi-fw-1	ATTAGGATGTCCTGATCCAACATCGAGG
BMP7-C-allele_HiDi-fw-1	ATTAGGATGTCCTGATCCAACATCGAGC
BMP7-HiDi-rev-1	ACCACACAAGTCTAAGTGAGTTATTACAC

The genotypes of *SOST* and *ST8SIA1* were determined by Sanger sequencing. DNA was amplified at the position of a selected tSNP in complete LD ( $r^2 > 0.95$ ; **Appendix Table 1**) by PCR (annealing temperature: *SOST* (54 °C), *ST8SIA1* (53°C), elongation time 30'') with Taq DNA Polymerase (Biozym) and the following primers:

*SOST*-rs1976960-fw-2: GACCCTTCTCCTCCTTGCT  
*SOST*-rs1976960-rev-2: TGT CGTG ACT ATGC ATCCCT  
*ST8SIA1*-rs2728821-fw-1: TGGCCACTCTGCTCAGTATAA  
*ST8SIA1* rs2728821-rev-1: CTGAAACACTTACAGGGGCT

**Appendix Table 1.** LD associated SNPs\_CSE genes

The genotyped SNPs are given in bold letters, # indicates the index SNPs of the regional association plots of Figure 3. LD and frequencies are calculated using 1000Genomes phase 3 EUR populations.

Position	Nearest gene	SNP	LD (r2) EUR	EUR (freq)
chr12:109,222,331	<i>SSH1</i>	<b>rs73410922</b>	1	0.04

### RNA extraction, cDNA synthesis and qRT-PCR

After 6 hours of CSE incubation, the cells were washed 2x with PBS. Cell disruption and total RNA extraction was carried out using the RNeasy Mini Kit (Qiagen, Germany) according to the manufacturer's specifications. Subsequently, quantitative reverse transcription polymerase chain reaction (qRT-PCR) was performed with an amount of 200-500 ng of total RNA using the High-Capacity cDNA Reverse Transcription Kit and oligo-(dT)-primers (Thermo Fisher Scientific, USA) in accordance with the manufacturer's guidelines (using oligo-(dT)- and dNTP-primers instead of random primers). Control PCR reactions contained water instead of cDNA. qRT-PCR experiments were performed using the CFX Connect System (Bio-Rad, USA) in combination with SYBR Select Master Mix (Thermo Fisher Scientific) by following the manufacturer's instructions. The gene expression levels were normalized to the mRNA expression of *GAPDH*, and relative expression was calculated using the mathematical model delta delta ct (GraphPad Prism Software/R). Genes were first screened for stable expression in pGFs (cycle threshold Ct < 35). Genes that were expressed at levels below Ct < 35 were excluded from further analysis.

Primers were manufactured (metabion GmbH, Planegg/Steinkirchen, Germany) with the following sequences:

*ABLIM2* (forward: TGGTGGTGAGATCCTGGACT; reverse: GTAGGAGATCATGTCGGGGC)

*BMP7* (forward: CACCATCGAGAGTTCCGGTT; reverse: ACGTCTCATTGTCGAAGCGT)

*POTEC* (forward: ACTGCCCTCATACTTGCTGT; reverse: GCATACTCTGGCCGTCTG)

*SOST* (forward: TTCCCCGGATGTTGGCTAC; reverse: AGTTGGGGCGGATGTGATTT).

*SSH1* (forward: GGAGGCACAACACTTCCCC; reverse: TTCCACTCGTTGATGCAGCT)

*ST8SIA1* (forward: TGTGTCGTGGTCCTCTGTTG; reverse: CCCCTGCACGATCTCTTCT)

*GAPDH* (forward: CAAATTCCATGGCACCGTCA; reverse: CCTGCAAATGAGCCCCAG)
