

Supplementary Materials and Methods

Enzyme-linked immunosorbent assay (ELISA)

Serum levels of pepsinogen A (PGA), pepsinogen C (PGC) and gastrin-17 (G17) were measured by ELISA kits (Shanghai Bluegene, Shanghai, China). The protein concentration was calculated using a standard curve obtained from measuring the absorbance of known concentrations of highly purified recombinant proteins. Briefly, 0.5 mL of conditioned medium was centrifuged at 12000 × g for 10 min at 4 °C and the supernatant was stored at -70 °C for 72 h. Thawed supernatant (100 µL) was used in the ELISA according to the manufacturer's instructions. The optical absorbance of the samples was measured at 450 nm.

Tissue collection and RNA extraction

Gastric tissues from mice were snap-frozen in liquid nitrogen immediately after resection and stored at -80 °C until use. Trizol reagent was used to extract total RNA from frozen samples, according to the manufacturer's protocols, which were then eluted with 100 mL of nuclease-free water. Total RNA was quantified using the NanoDrop ND-2000 spectrophotometer (Thermo Scientific, Wilmington, MA) and the RNA integrity was assessed using Agilent Bioanalyzer 2100 (Agilent Technologies, Santa Clara, CA).

LncRNA and mRNA microarray expression profiling

Microarray profiling was performed in the laboratory of OE Biotechnology Company (Shanghai, China). Sample labeling, microarray hybridization, and washing were performed based on the manufacturer's standard protocols. Briefly, mRNA was purified from total RNA after removal of rRNA by using an RNA Isolation Kit (Epicentre

Biotechnologies, Madison, WI). Then, each sample was transcribed to double-stranded cDNA, then synthesized into cRNA and labeled with Cyanine-3-CTP. The labeled cRNAs were hybridized onto the mouse lncRNA array (Agilent Mouse lncRNA 4*180K, Design ID: 049801), including the global profiling of 51,302 lncRNAs and 39,430 coding transcripts. After washing, the arrays were scanned with the Agilent Scanner G2505C (Agilent Technologies, Santa Clara, CA). Feature Extraction software (version 10.7.1.1, Agilent Technologies) was used to analyze the array images and extract the raw data. Genespring (Version 12.5, Agilent Technologies) was employed to complete the basic analysis of the raw data. To begin with, raw data was normalized using the quantile algorithm. The probes that had at least 1 condition out of 2 conditions flagged as “*P*”, were chosen for further data analysis. Differentially expressed lncRNAs and mRNAs were then identified through fold-change as well as *P* values, calculated using *t*-test. The threshold set for up- and down-regulated genes was fold change ≥ 2.0 and a *P* value < 0.05 . Then, Hierarchical Clustering was performed to display the distinguishable expression patterns of lncRNAs and mRNAs, among the samples.

Functional group analysis

KEGG analysis were performed to determine the biological roles of the differentially expressed mRNAs, based on the latest KEGG (Kyoto Encyclopedia of Genes and Genomes) database (<http://www.genome.jp/kegg/>). The KEGG enrichment of the differentially expressed mRNAs was implemented using the hypergeometric test, in which the *P* value was adjusted by multiple comparisons as q-value. KEGG terms with $q < 0.05$ were considered to be significantly enriched.

Co-expression of lncRNAs with mRNAs and functional prediction

Most of the lncRNAs in current databases have not yet been functionally annotated. Thus, the prediction of their functions is based on the functional annotations of their co-expressed mRNAs. This method was originally described by Guttman *et al.* [1]. For every dysregulated lncRNA, Pearson correlation coefficient (PCC) of its expression with that of each dysregulated mRNA was calculated to find its co-expressed mRNA, with a PCC > 0.8 or < 0.8 and a *P* value of PCC < 0.01 as being statistically significant. Then, a functional enrichment analysis of the co-expressed mRNAs was conducted using the hypergeometric cumulative distribution function, and the enriched GO/KEGG pathway annotations were assigned to the lncRNA as its predicted function. The threshold of statistical significance is set at a *P* value of < 0.05 and a false discovery rate of (FDR) < 0.01 (under the control of the Benjamini- Hochberg procedure [2]). Also, on the basis of co-expression, we further explored how these dysregulated lncRNAs might exert their functions through *cis*- and/or *trans*-regulating protein-coding genes. We defined *cis*-regulated genes as protein-coding genes co-expressed with one dysregulated lncRNA and within 100 kb in genomic distance in the same allele. We defined potentially *trans*-regulated protein-coding genes as co-expressed and beyond 100 kb in genomic distance from, or on the other allele of, differentially expressed lncRNAs. In other words, any protein-coding gene co-expressed with a lncRNA, which did not fit the criteria of *cis*-regulated, it was categorized as potentially *trans*-regulated.
