Supplemental Data 3

The propensity score is defined as the probability of receiving treatment based on measured covariates:

$$e(x) = P(Z=1 | X)$$

where $e(x)$ is the abbreviation for propensity score, P a probability, $Z=1$ a treatment

indicator with values 0 for control and 1 for treatment, the " $|$ " symbol stands for conditional on, and X is a set of observed covariates.

Supplemental Data 4

The equation used for calculating standardized mean difference

$$SMD = \frac{\bar{X}_1 - \bar{X}_2}{\sqrt{(S_1^2 + S_2^2)/2}}$$

\bar{X}_1 and \bar{X}_2 are sample mean for the treated and control groups, respectively; S_1 and S_2 are sample variance for the treated and control groups.

For dichotomous variables, the following formula is used to calculate standardized mean difference

$$SMD = \frac{\hat{p}_1 - \hat{p}_2}{\sqrt{[\hat{p}_1(1 - \hat{p}_1) + \hat{p}_2(1 - \hat{p}_2)]/2}}$$

where p_1 and p_2 are prevalence of dichotomous variables in the treated and control groups, respectively.
