

Supplementary Figure 1. Individuals included in this research.

Abbreviations: MDCS, Malmö Diet and Cancer study; ApoA1, apolipoproteins A1; ApoB, apolipoproteins B; AAA, abdominal aortic aneurysm; CHD, coronary heart disease.

Supplementary Figure 2. Comparisons of different risk factors for AAA and CHD in male (A) and female (B) subjects.

The model was adjusted for age, sex, marriage status, education, smoking, diabetes, waist, systolic blood pressure, anti-hypertensive medication, ApoB/ApoA1 ratio, anti-lipid medication, and white blood cell count. ApoA1 and ApoB not adjusted for ApoB/ApoA1 ratio. Diastolic blood pressure not adjusted for systolic blood pressure. Differentiated leucocyte not adjusted for white blood cell count.

*p-value for equal associations. A significant p-value indicates that the risk factor has different associations with AAA and CHD, respectively. The Lunn-McNeil method and log likelihood test were used to calculate the p-values (see methods for details).

Abbreviations: AAA, abdominal aortic aneurysm; CHD, coronary heart disease; ApoA1, apolipoproteins A1; ApoB, apolipoproteins B; NLR, neutrophil to lymphocyte ratio.

Supplementary Table 1. Validation of patients with AAA and ruptured AAA (rAAA).

Characteristics	AAA (n=80)	rAAA (n=18)	p
Confirmed diagnosis, (%)	76/80 (95%)	17/18 (94.4)	1.000
Median (IQR) age; years	76 (71 – 80)	84 (78 – 85)	<0.001
Male sex, (%)	58/76 (76.3)	12/17 (70.6)	0.620
Median maximal AAA diameter (IQR); mm	50 (40 – 64)	78 (56 – 98)	<0.001
Operated at the time of diagnosis, (%)	5/76 (6.6)	10/17 (58.8)	
EVAR	5	8	<0.001
Open repair	0	2	
Mortality within 30 days of diagnosis, (%)	0/76 (0)	11/17 (64.7)	<0.001
Initial mode of diagnosis, (%)			
Imaging due to AAA-related symptoms	2	16	
Accidental finding at any imaging	56	0	
Palpation	12	0	
Autopsy	0	1	
Organized ultrasound screening for AAA	2	0	
Non-organized ultrasound screening for AAA	4	0	

In our study population, 447 individuals developed AAA. Among them, 212 (47.4%) were from the inpatient register, 211(47.2%) from hospital-based outpatient care and 24 (5.4%) from the cause-of-death register. Among the 134 individuals with severe AAA, 88(65.7%) from the inpatient

register, 26(19.4%) from hospital-based outpatient care and 20 (14.9%) from the cause-of-death register. Corresponding number in the 313 non-severe AAA population were 124 (39.6%), 185 (59.1%) and 4 (1.1%), respectively. There were 70 (15.7%) ruptured AAA patients in this study. Among them, 43 (61.4%) were from the inpatient register, 7 (10%) from hospital-based outpatient care and 20 (28.6%) from the cause-of-death register; the distribution in 373 non-ruptured AAA were 165 (44.2%), 204 (54.7%) and 4 (1.1%), respectively.

Abbreviations: AAA, abdominal aortic aneurysm; rAAA; ruptured abdominal aortic aneurysm, EVAR; Endovascular aneurysm repair, IQR; interquartile range.

Supplementary Table 2. Incidence rates (per 1000 person years) for AAA and CHD in categories of selected risk factors.

n=26688	AAA	CHD
Exposures	Number of cases (per 1000 person-years)	Number of cases (per 1000 person-years)
All	447 (0.85)	3129 (6.08)
Men	334 (1.72)	1822 (9.79)
Women	113 (0.34)	1307 (3.98)
Smokers	271 (1.90)	1072 (7.77)
Diabetes	18 (0.95)	302 (17.2)
SBP $\geq$160 mmHg	131 (1.33)	1033 (11.02)
DBP $\geq$100 mmHg	93 (1.86)	501 (9.56)
High ApoA1	47 (0.12)	523 (3.84)
High ApoB/ApoA1 ratio	235 (1.86)	1263 (10.52)

High ApoA1 and high ApoB/ApoA1 were defined as at the 4th quartile of ApoA1 (>174 mg/L) and 4th quartile of ApoB/ApoA1 ratio (>0.834) in this study, respectively. The incident rate was present as per 1000 person-years.

Abbreviations: AAA, abdominal aortic aneurysm; CHD, coronary heart disease; SBP, systolic blood pressure; DBP, diastolic blood pressure; ApoA1, apolipoproteins A1; ApoB, apolipoproteins B.

Supplementary Table 3. Comparison of risk factors for AAA and CHD (excluding those who developed both AAA and CHD).

Model 1: adjusted for age and sex

Model 2: adjusted for age, sex, marriage status, education, smoking, diabetes, waist, systolic blood pressure, anti-hypertensive medication, ApoB/ApoA1 ratio, anti-lipid medication, and white blood cell count. ApoA1 and ApoB not adjusted for ApoB/ApoA1 ratio. Diastolic blood pressure not adjusted for systolic blood pressure. Differentiated leucocyte not adjusted for white blood cell count.

Diastolic blood pressure and systolic blood pressures were grouped by 10mmHg intervals; Waist circumference was grouped by quartile.

* A significant p-value indicates that the risk factor has different associations with AAA and CHD, respectively. The Lunn-McNeil method and log likelihood test were used to calculate the p-values (see methods for details).

Abbreviations: MDCS, Malmö Diet and Cancer study; AAA, abdominal aortic aneurysm; CHD, coronary heart disease; ApoA1, apolipoproteins A1; ApoB, apolipoproteins B; NLR, neutrophil to lymphocyte ratio.

Supplementary table 4. Comparison of risk factors for sAAA and non-sAAA.

Model 1: adjusted for age and sex

Model 2: adjusted for age, sex, marriage status, education, smoking, diabetes, waist, systolic blood pressure, anti-hypertensive medication, ApoB/ApoA1 ratio, anti-lipid medication and white blood cell count. ApoA1 and ApoB not adjusted for ApoB/ApoA1 ratio. Diastolic blood pressure not adjusted for systolic blood pressure. Differentiated leucocyte not adjusted for white blood cell count.

Diastolic blood pressure and systolic blood pressures were grouped by 10 mmHg intervals; Waist circumference was grouped by quartile.

* A significant p-value indicates that the risk factor has different associations with sAAA and non-sAAA, respectively. The Lunn-McNeil method and log likelihood test were used to calculate the p-values (see methods for details).

Abbreviations: MDCS, Malmö Diet and Cancer study; sAAA, severe AAA; ApoA1, apolipoproteins A1; ApoB, apolipoproteins B; NLR, neutrophil to lymphocyte ratio. Severe AAA was defined as a (1) AAA as underlying or primary cause of death, or (2) surgery for AAA within 60 days after first diagnosis, or (3) ruptured AAA.
